5. Rancangan tabel prediksi banjir dimasa depan dengan prediksi dalam 50 tahun kedepan rata-rata suhu udara naik $\pm 2^{\circ}\text{C}$ karena dampak dari pemanasan global yang memicu suhu rata-rata mengalami kenaikan yang signifikan. Jadi disini digunakan rata-rata suhu udara 29°C dengan menggunakan rata-rata kelembapan udara 70%.

6. Berdasarkan dataset rata-rata suhu udara 29°C dengan rata-rata kelembapan 70% kemudian diolah menggunakan model konfigurasi terbaik 10 untuk mendapatkan nilai prosentase banjir. Tabel dibawah ini merupakan hasil yang didapatkan dari model konfigurasi 10, dimana secara umum prediksi kejadian banjir dimasa depan saat musim kemarau membutuhkan curah hujan yang sangat banyak lebih dari 100mm agar dapat membuat prosentasenya menjadi 100% sedangkan pada musim hujan relatif stabil untuk mencapai prosentase 100% membutuhkan curah hujan minimal 60mm. Jadi berdasarkan tabel prediksi ini dimasa depan banjir akan lebih sering terjadi lagi di musim hujan dan di musim kemarau akan sangat jarang sekali dijumpai kejadian banjir.
